

Top 10 Crypto MCPs (Setup + Prompts Included)

Claude

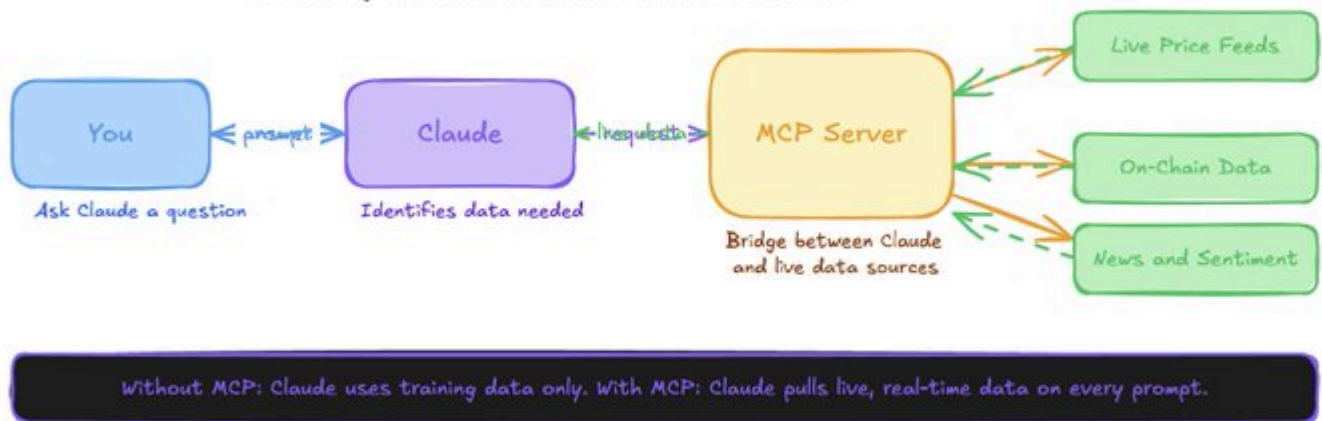

How To Turn Claude Into A Crypto Trading Beast (10 MCPs) If you do just one thing to gain an edge in the markets this week, make it this. In under 10 minutes, I will show you how to turn Claude into the most powerful crypto research and trading tool you have ever used. For the past year, I've been using various crypto MCP connections to give me an unfair edge in the financial markets. These MCPs allow me to track on-chain data, pull live crypto price feeds, get real-time news updates, and even use AI agents to trade. Most traders have no idea this is possible (and I don't blame them). Everyone who is using MCPs in their trading is gatekeeping the sauce. Today, I am giving you the full list, the setup instructions, and the exact prompts worth using with each one. This is one of the most valuable crypto articles I could give you, and this information is genuinely hard to find - be sure to save this so you don't lose it. Contents I: What Even Is an MCP? II: How to Set Up Any Crypto MCP III: My Top 10 Crypto MCPs IV: Putting it All Together (turning Claude into your central research hub) Final Thoughts

What Even is an MCP?

If you have been using Claude and wondering how to make it actually useful for crypto research, this is the answer. MCP stands for Model Context Protocol. It is an open standard that allows Claude (or any AI tool) to connect directly to external data sources. It's like a bridge between Claude's brain and an external tool, in real time. Without MCP, Claude is working from training data with a knowledge cutoff. I.E., it cannot tell you current prices, nor can it track what whales are doing on-chain right now. By connecting an MCP, you're essentially giving Claude real-time access to market tools.

How an MCP Server Works

Connecting Claude to live external data and tools

How an MCP Server Works To gain an edge with MCPs, you don't need to know how they actually work under the hood; just think of them as a bridge between two places (in this case, Claude and a crypto tool). Let me show you how to set any crypto MCP up in <5 minutes.

How to Set Up Any Crypto MCP

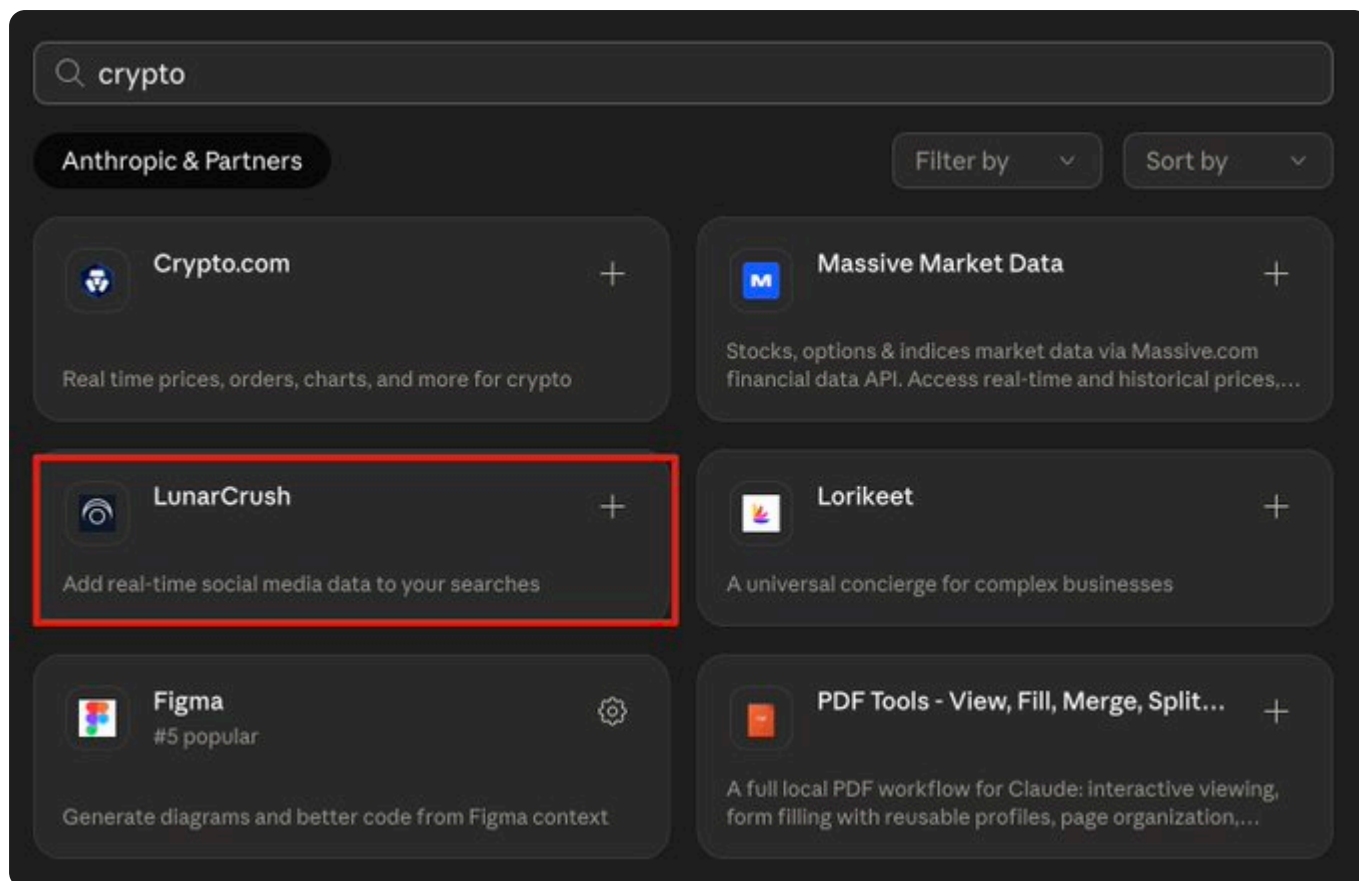

The setup process is almost identical across all MCP servers on this list. Learn it once, and you can install any of the ten in under two minutes each. What you need before starting:

- The Claude desktop app - download it at claude.com/download
- Node.js - download it at [.org](https://nodejs.org).

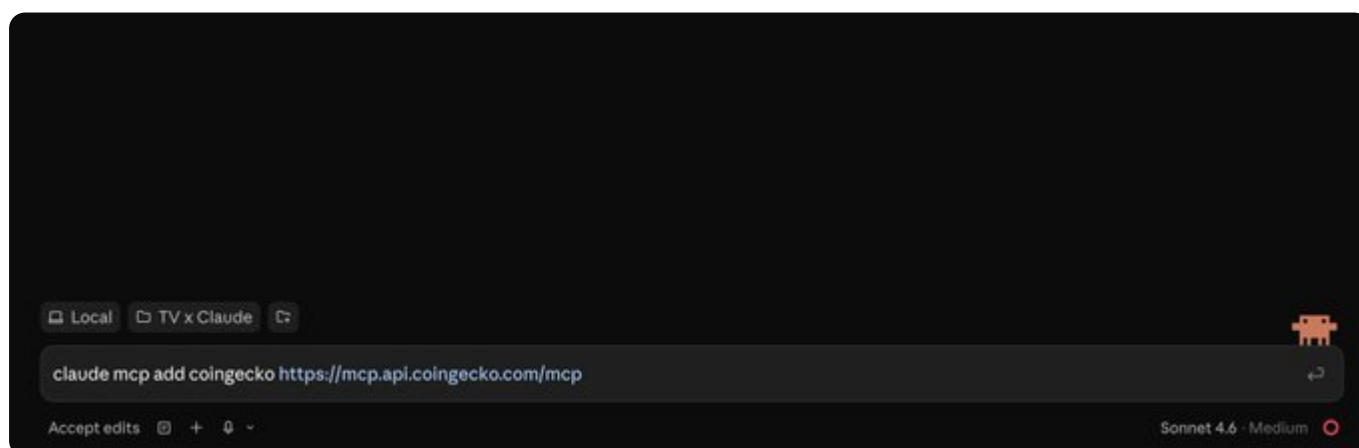

Once you have both of these, there are two methods for installing MCPs:

1. Connectors

In Claude → Customize → Connectors, you can search for crypto MCPs At the time of writing, only one of the MCPs on my personal top 10 list is available to connect through this method. Still, I'm including it anyway, as it's the easiest, and I suspect more companies will make their MCPs available this way soon.

Claude → Connectors 2. Claude Code Prompt Installation The second method is through prompting Claude Code. This will be your primary method. Open your Claude Desktop app, switch to Claude Code, and type: `Claude mcp add` Then, when prompted, paste the URL for the connection you want to install, and Claude Code handles everything else automatically. For example, a full command would look like this: `claude mcp add coingecko`
<https://mcp.api.coingecko.com/mcp> *example not real*

`claude mcp add [paste server]` In my top 10 list below, I include the link to every MCP, so don't worry about sourcing these servers yourself - just paste the link and prompt Claude to help you install it. Aside from this server URL command, you'll also need an API key from the platform you're trying to install. My advice: if you can't find where to get an API key, just prompt Claude Code to source the information on how/where to get your free API key for [x] MCP. For any troubles during this process, just say: "I'm having trouble installing [x] MCP, help me." Now that you know how to

install connections, let's dive into my top 10 crypto MCP list. Each mention includes: a connection link, what the MCP is good for, and example prompts imo, #10, #2, and #1 are complete game-changers , and the top three you should install ASAP

#10: LunarCrush (@LunarCrush)

LunarCrush is one of the most powerful social intelligence platforms in crypto. Installing their MCP allows you to scan social data - what's trending in crypto, social engagement scores, and more. Example prompts to use "What are the top 10 cryptocurrencies by social sentiment right now? Show me the sentiment score and 24-hour change for each." "Which coins have seen the biggest spike in social engagement in the last 6 hours that price has not yet reacted to?" "Give me a full social intelligence report on Solana — sentiment trend, top content, engagement metrics, and any signals worth watching." This MCP is super easy to install, since it's the only MCP on this list you can access through the "Connectors" tab in Claude.

#9: CoinMarketCap (@CoinMarketCap)

CoinMarketCap is the most widely used crypto data platform in the world. I primarily use it for basic data like price feeds, market cap rankings, volume, circulating supply, etc. Example prompts to use "Show me the top 20 cryptocurrencies by market cap right now. Include price, 24 hour change, volume, and market dominance for each." "What are the trending narratives in crypto right now? Which sectors are seeing the most capital inflow this week?" "Give me a full market overview — total market cap, Bitcoin dominance, Fear and Greed index, and the top three macro events affecting markets today." Connection Link: <https://coinmarketcap.com/api/mcp/>

#8: CryptoPanic

CryptoPanic is an excellent MCP connection for news. It pulls breaking news, regulatory updates, market-moving stories, and more in real-time. Example prompts to use "What are the five most important crypto news stories from the last two hours? For each one tell me which assets are affected and whether the sentiment is bullish or bearish." "Scan the latest crypto news and flag anything that could be a significant market-moving event in the next 24 hours. Include the story, the affected asset, and your reasoning." "Give me a news sentiment summary for Bitcoin, Ethereum, and Solana based on everything published in the last 12 hours." Connection Link: github.com/kukapay/cryptopanic-mcp-server

#7: DeFi Portfolio MCP

This is the connection for anyone actively managing positions across DeFi protocols. It is a self-custodial crypto portfolio and DeFi MCP server that lets you read balances and positions across Aave, Compound, Morpho, Uniswap V3 & more and prepares transactions for approval via WalletConnect. The keyword is self-custodial. Your private keys never leave your device. Claude reads your positions and prepares transactions, but all approvals happen through WalletConnect - meaning you stay in control of every action. Example prompts to use "Give me a full breakdown of all my DeFi positions across every protocol and chain. Include current value, yield earned, and health factor for any lending positions." "Which of my current DeFi positions has the lowest yield right now? Compare it against the best available rates on Aave and Compound and tell me if I should rebalance." "Check my Uniswap V3 positions and tell me which ones are out of range and losing fee income right now." Connection Link: <https://github.com/edkdev/defi-trading-mcp> Note: this connection requires wallet access - always start with a test wallet

#6: CoinGecko MCP (@coingecko)

If you've been following me for a while, you may remember CoinGecko MCP being one of the first MCP servers I ever set up. It's an excellent connection and probably the most comprehensive crypto data source on this entire list. Best for real-time price feeds, access to millions of tokens, on-chain data, trending token analysis, and related topics. Example prompts to use "Show me the top 10 trending coins on CoinGecko right now. For each one include the price, 24 hour change, volume, and which chains it is available on." "Find me tokens with a circulating supply of at least 90% of total supply, a market cap under \$500 million, built on Solana or Ethereum, with positive price performance over the last 7 days." "Give me a full on-chain analysis of the top 5 liquidity pools on Base right now — TVL, volume, fees generated in the last 24 hours, and any unusual activity worth noting." Connection Link: <https://docs.coingecko.com/docs/ai-agent-hub/mcp-server>

#5: altFINS

This is the server built specifically for traders who want actionable intelligence rather than raw price feeds. The altFINS MCP server provides 300+ pre-computed data points per coin. including 150+ technical indicators - RSI, MACD & more. Example prompts to use "Show me crypto coins that just crossed above their SMA200 with increasing volume. Include the coin, current price, and the signal strength." "Find me mid-cap altcoins that are oversold on RSI but still in an overall uptrend across the daily and weekly timeframes. Rank them by signal strength." "Give me a complete technical analysis of SOL — current indicators, key support and resistance levels, active chart patterns, and any trading signals worth acting on right now." Connection Link: <https://altfins.com/crypto-market-and-analytical-data-api/documentation/mcp-server/>

#4: GOAT SDK

GOAT SDK turns Claude from a pure research assistant into an executioner. GOAT is an on-chain agent toolkit that you can use for real swaps, token transfers, balance checks, DeFi interactions, and more. Example prompts to use "Check my wallet balance across all connected chains and give me a full breakdown of my holdings by token and chain." "What is the current price of ETH and how much would I receive if I swapped 0.1 ETH for USDC right now? Show me the best rate available." "Scan my wallet for any tokens with less than \$10 in value and give me a summary of what I could consolidate to clean up my portfolio." Connection Link: <https://github.com/goat-sdk/goat> Note: this connection requires wallet access - always start with a test wallet

#3: Perplexity (@perplexity_ai)

Every other server on this list connects Claude to a specific data source. Perplexity MCP connects Claude to the entire live internet and is my #1 source not only for crypto research but for ALL financial research. Example prompts to use "Search the live web for everything that has happened in crypto in the last 6 hours. Summarise the five most market-moving stories and tell me which assets are affected." "Run a deep research report on Hyperliquid — protocol overview, recent performance, competitive landscape, risks, and any significant developments from the last 30 days. Cite all sources." "Search for any regulatory developments affecting crypto in the US, EU, and Asia from the last 7 days. Give me a summary of each and whether the overall regulatory trend is bullish or bearish for the market." Connection Link: <https://docs.perplexity.ai/docs/getting-started/integrations/mcp-server>

#2: Dune (@Dune)

You won't find another crypto tool as powerful as Dune for on-chain analytics. Best for on-chain deep dives, deep research, and prompting custom dashboards. Example prompts to use "Show me all stablecoin transfers over \$1 million across Ethereum and Base in the last 24 hours. Include the wallet addresses, amounts, and timestamps." "Who are the top 10 wallets accumulating RWA tokens in the last 30 days? Show me wallet address, total value accumulated, and which tokens they are buying." "Compare Uniswap versus Curve daily swap volume over the last 90 days. Show me the trend and tell me which protocol is gaining or losing market share." Connection Link: <https://docs.dune.com/api-reference/agents/mcp>

#1: TradingView

My #1 crypto/finance MCP right now is hands down the new TradingView connection. Best for: managing alerts, scanning your charts in real-time, deep technical analysis, coding custom indicators, and more. In case you missed it, here is my full TradingView guide where I walk you

through how to set it up, real prompt examples, and more: Connection Link:

<https://github.com/LewisWJackson/tradingview-mcp-jackson>

Putting It All Together

So, you have a few MCPs installed. Now, how do you actually use them to gain a market edge?

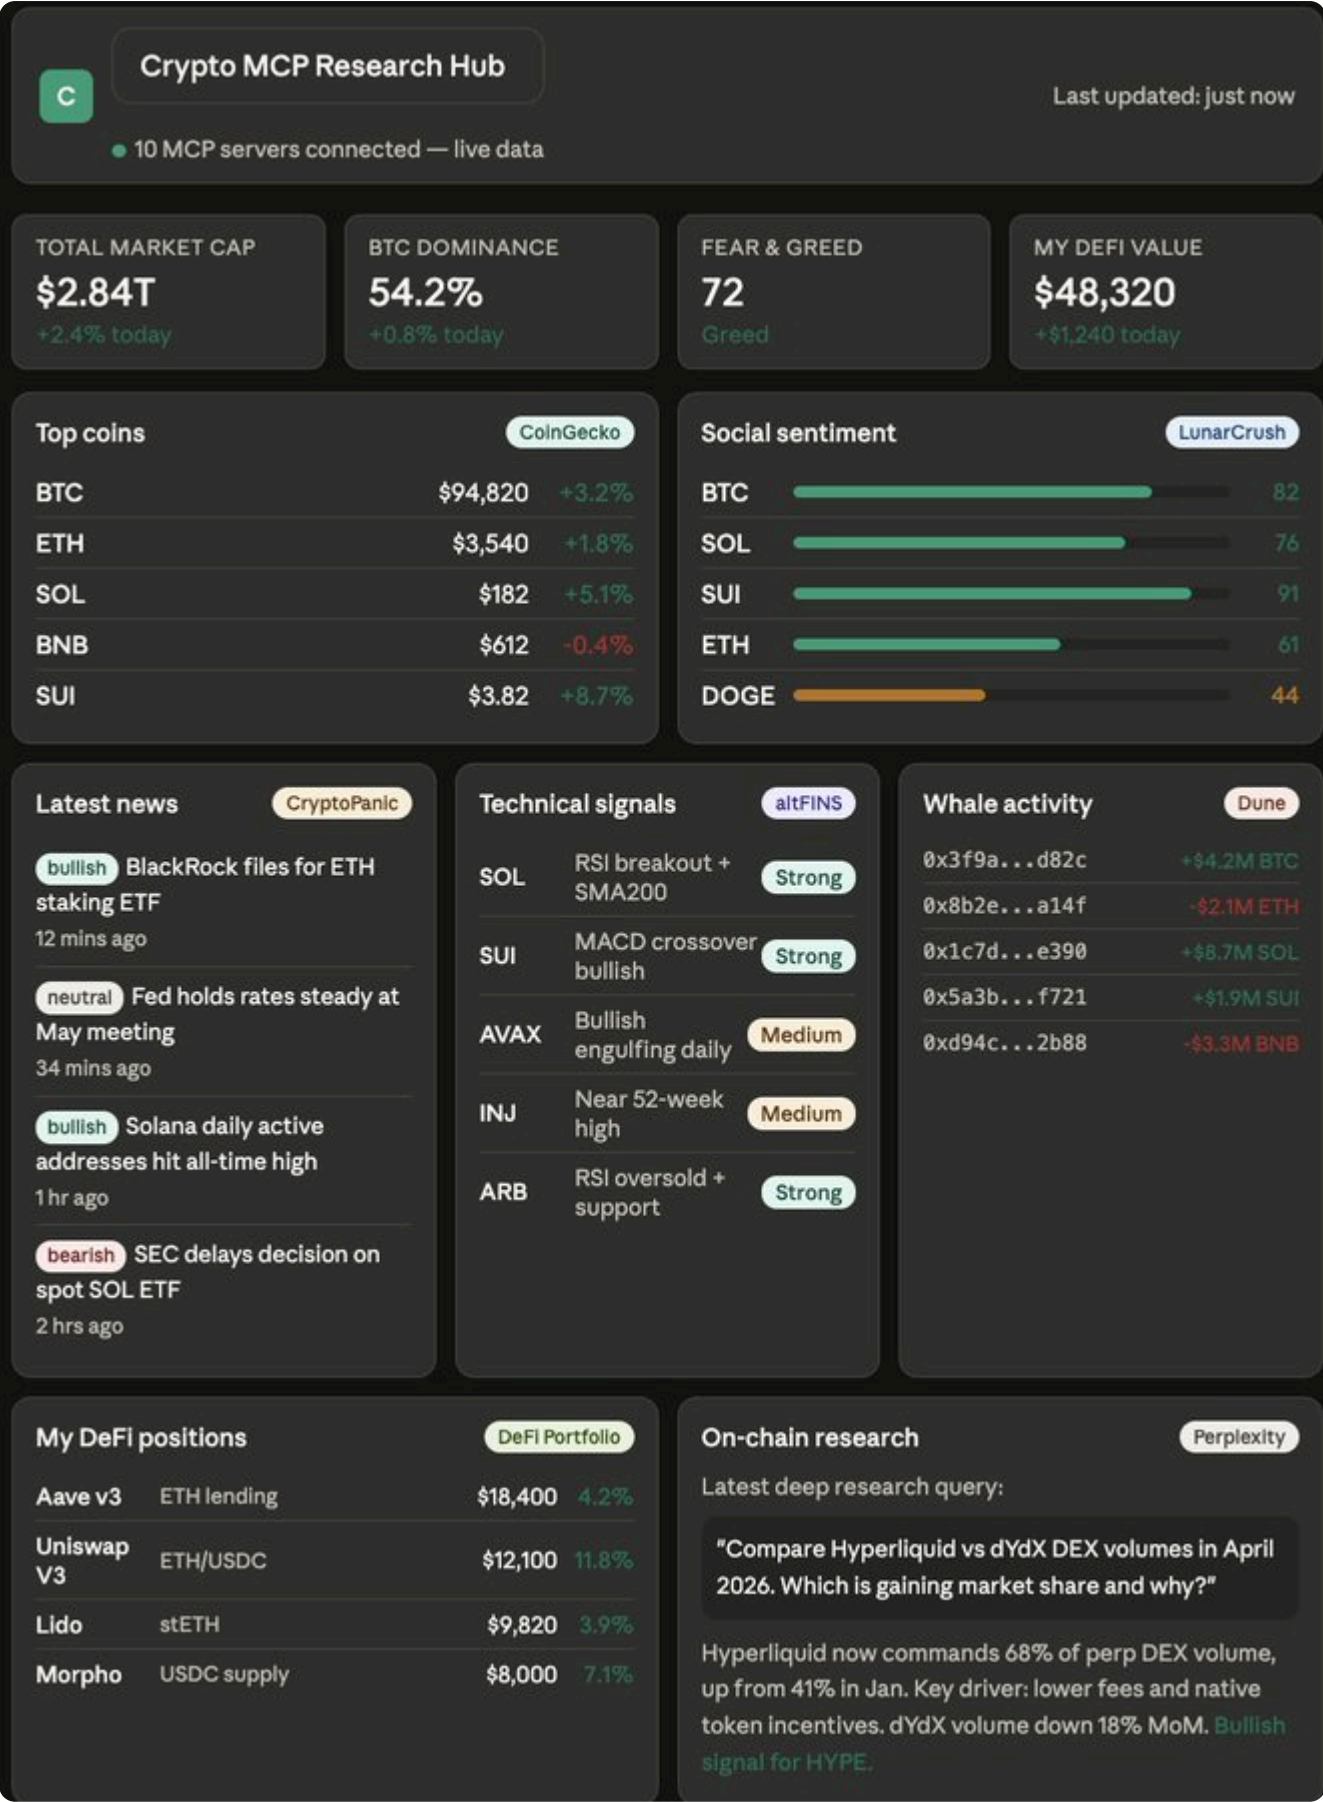

There are two primary methods I like:

1. Claude Projects (No Coding Required)

The fastest way to turn Claude into a central crypto research hub is a single system prompt within a project that activates all your connected servers simultaneously and tells Claude exactly how to use them together. **Getting Started** Create a new Claude Project and label it "Crypto Research Hub." Then, paste these custom instructions, which tell Claude how to proactively use all your new connections: You are my personal crypto research analyst and trading intelligence system. You have access to the following live data connections and should use them proactively whenever relevant: LunarCrush — social sentiment and social intelligence data CoinMarketCap — market data, rankings, and trending narratives CryptoPanic — real-time crypto news and sentiment DeFi Portfolio — my live DeFi positions and balances CoinGecko — on-chain data, token analytics, and DEX data altFINS — technical analysis, trading signals, and screener data GOAT SDK — on-chain execution and wallet data Perplexity — live web search and deep research Dune — on-chain SQL analytics across 100 plus blockchains TradingView — live chart data, indicators, and Pine Script Every time I ask a market question, pull from the most relevant data sources automatically. Do not wait for me to specify which server to use — use your judgment based on what the question requires. My trading style: [describe your approach — swing trader, DeFi analyst, crypto researcher, etc.] Assets I follow: [list your primary watchlist] My risk tolerance: [conservative, moderate, aggressive] Format all research outputs with: a one-line summary at the top, the key data points, your analysis, and a clear actionable conclusion. Never pad responses. Every sentence should earn its place. Now, anytime you send a prompt that requires Claude to access your MCP connections, it knows exactly how to pull the data and format it. Feel free to modify these instructions to your liking.

2. Vibe-Coded Crypto Research App

This is a good option for those of you who want a visualization layer. Using the MCP connections, you can vibe-code a custom app that visualizes all the data in one place. Example:

Example: Crypto Research MCP Hub Mega Prompt: Build me a local crypto research dashboard as a single HTML file called crypto-hub.html. The dashboard should be dark themed, auto-refresh every 5 minutes, and pull live data from all of my connected MCP servers simultaneously. It should look and feel like a professional trading terminal — clean, dense, and information-rich. Layout and

panels to include: Top bar — dashboard title, live status indicator showing all connected MCP servers, and last updated timestamp. Metric row — four summary cards across the top showing: Total Market Cap (CoinMarketCap), BTC Dominance (CoinMarketCap), Fear and Greed Index (CoinMarketCap), and My Total DeFi Value (DeFi Portfolio MCP). Row 2 — two panels side by side: Top Coins panel: top 10 coins by market cap with price, 24 hour change, and volume from CoinGecko Social Sentiment panel: top trending coins with sentiment scores and social momentum from LunarCrush Row 3 — three panels side by side: News Feed: latest 5 crypto news stories with bullish/bearish/neutral sentiment tags from CryptoPanic Technical Signals: top 5 trading setups ranked by signal strength from altFINS — include coin, signal type, timeframe, and strength rating Whale Activity: latest large on-chain transactions from Dune — wallet address, action, asset, and value Row 4 — two panels side by side: My DeFi Positions: live breakdown of all positions across Aave, Uniswap V3, Lido, Compound, and Morpho from DeFi Portfolio MCP — show protocol, position type, current value, and APY Research Panel: shows the output of the latest Perplexity deep research query with source citations Bottom section — a prompt input bar where I can type any question and Claude will automatically pull from all connected servers to answer. Show active MCP server pills below the input confirming which servers are live. Technical requirements: Use Chart.js for any charts. Dark background with teal accent color for positive values and red for negative. Each panel should show a small tag in the corner indicating which MCP server it is pulling from. All data should refresh every 5 minutes automatically with a countdown timer visible. If a server returns no data, show a graceful loading state rath This is an example prompt - feel free to modify your research app to look however you'd like. Of course, there are many more ways to use these MCPs. You could go as far as to build highly customised apps with even more data integrations - but for the average person, I think the two above methods are best.

Final Thoughts

So, there you have it - my complete crypto MCP guide. Hopefully, you found it valuable. If you did, be sure to follow me @milesdeutscher for more articles like this. If you enjoy crypto x AI content, feel free to subscribe to my brand new crypto x AI newsletter, where I break down how to use AI in your trading. <https://milesdeutscher.com.au/>
